Data Dictionary (Metadata)

Influencer Marketing ROI Dataset | influencer_marketing_roi_dataset.csv

1. Overview

The dataset contains **150,000 influencer marketing campaigns** described by **10 columns**. Each row is one campaign: where it ran, what type it was, how long it lasted, how much engagement it produced, and how many sales resulted. In the original file there are no missing values and no duplicated rows.

2. Column descriptions

Column	Meaning	Type	Values / range
campaign_id	Unique ID of the campaign	Text (ID)	CAMP100000 and up; 150,000 unique values
platform	Social platform used	Categorical	Instagram, YouTube, TikTok, Twitter
influencer_category	Influencer's niche	Categorical	Food, Tech, Fashion, Gaming, Travel, Beauty, Fitness
campaign_type	Goal of the campaign	Categorical	Seasonal Sale, Product Launch, Brand Awareness, Giveaway, Event Promotion
start_date	Campaign start date	Date (text)	From 1/1/2022
end_date	Campaign end date	Date (text)	After start_date
campaign_duration_days	Campaign length in days	Integer	1 to 29 (mean about 15)
engagements	Likes, comments and shares	Integer	100 to 99,999 (mean about 50,000)
estimated_reach	Expected number of people reached	Integer	1,002 to 999,992 (mean about 500,000)
product_sales	Sales generated by the campaign	Integer	0 to 4,999 (mean about 2,500)

3. Column roles in the project

Role	Columns
Target (what we predict)	product_sales
Categorical features	platform, influencer_category, campaign_type
Numeric features	engagements, estimated_reach, campaign_duration_days
Date features	start_date, end_date
Identifier only (not used as a feature)	campaign_id

4. Observations from data understanding

• **Synthetic data.** Numeric columns are spread almost evenly across their ranges (for example sales from 0 to 4,999), which is not typical of real campaign data.

• **Unrealistic dates.** start_date runs from 2022 up to the year 2432 (one new campaign per day in sequence). This is an error in the original data.

• **Redundant columns.** campaign_duration_days equals end_date minus start_date for every row, so three columns carry the same information.

• **Engagement vs. reach.** In some rows engagements exceed estimated_reach (the ratio reaches about 98 times), which is not realistic. It exists in the original data and was left unchanged.
